ABSTRACT

Future just depends on a few of them who were innovative and has an ability to think. Present generation is a lot depending on the shortcut methods for solutions rather than reasoning on the solution. When we come to analysis the present situation we can't judge that inventions are not happening. Many inventions like latest gadgets, robotics were introducing and many scientific discoveries were succeeding, but its only due to some senior scientists and some innovative people. This article explains how new technologies affects the innovative and uniqueness of human beings.

1. Introduction

At present due to the dependence on Technology no one were thinking in a normal psychological behavior. All are just going through the shortcuts for solution to the situation. They were not utilizing their innovative ideology. If it continuous for few decades the basic naturalness of thinking and analyzing can be lost by humans. For past century we got a thousand's of inventions, their source for inventions was less. The persons, who discovered the things just build their ideas in an innovative manner through their thinking and reasoning ability, come to the present in high ratio people were not thinking and reasoning about the ideas or issues that naturally comes to their mind.

For example one student has a doubt "what if their were a colony on the moon "if he not thought

of it no one try to go in to the moon; It happened. Due to the addiction of modern technology of short way solutions it just pushing the younger generation a bit back than forward Let's take an example of the small kids who were addicted to the smart phones, the ideology of the kids addicted to the gadgets were go in a way that even at the age 12 they can't recognize what's going on their surroundings. Their reasoning skills were not in the normal level.

2. Pessimistic Of Ready Made Things

The child never tries to solve any problem with his own nativity of reasoning. They just depend on the technology to solve the problem which intern reduces their reasoning power, where they reduce their IQ power. If it continuous no new ideas or discoveries never happen. In the way of solving in

a reasoning process failure may occur but just remember that after a thousand failures Edison discovered the bulb if Edison lost his patience world never be lightens with brightness. It was the days where ideas were readymade, like the readymade food, As the packed food which was made few days ago doesn't contain enough minerals to sustain body, in the same way ideas which were readymade for our shortcuts were weaker than the innovative ideas thought by us according to our present circumstances. No way had the circumstances around bit corrupted with latest technology but we should be in the way of reasoning and developing the concept based education is better than depending on the technology to a level.

3. HOW TO IMPROVE REASONING SKILLS?

Having high reasoning skills can help in work, school, and interpersonal relationships. There are variety of ways to change your reasoning skills for better. Engage in activities that encourage critical thought, work on altering your patters, and learn to recognize irrational thoughts.

a. **Keep trying new things:**

The mind is like another muscle. It requires exercise and stimulation. Make a point of trying new.

b. **Exercise:**

Physical exercise actually has an effect on memory and thinking. Many studies include the parts of the brain responsible for thinking and reasoning are bigger in those who exercise regularly. Exercise reduces stress, anxiety and boosts mood, which can make it easier to concentrate and learn.

4. WRITING

Writing is an active endeavor, it forces you to expand and explore your thoughts. Keeping a journal that details your day, your feelings, and anything you thought about through out the day can make you a more introspective, aware person. This can lead to higher reasoning skills.

- Playing games that requires reasoning skills
- There are a variety of games that requires you to reason strategic board games, and games like chess bases on reasoning
- Force yourself to create on a regular basis that improves your creative knowledge
- Pay attention towards the purpose behind your actions
- Identify your biases, whether you are aware of them or not
- Avoid catastrophic thinking

Pay attention to how you read situations according to our present circumstances. No solutions. I sort of thinking when I noticed Einstein's quotation **"Imagination is more important than knowledge"**
